

Corona Cases are picking up.

McKana. January 5, 2024

Since we have been writing few messages since the pandemic started, seeing the current developments, we found it necessary to warn all that there is a current resurgence of corona throughout the world. The current trend are:-

1. Authorities are not much concerned and no one is taking daily data, here and globally.
2. Corona the pandemic has mutated (Another new strain called *JN.1 is descended from BA.2.86, or Pirola*)
3. The three sequences of Jabs and three boosters have waned and provide no protection against the new mutant strain. (remember what we warned for long)
4. Except natural immunity, there is no protection for the new mutant strain and cases and death here in the US and around the world are picking up. (see note at the end)
5. Regardless of failed data collections, from what has been recorded, almost half of the cases and deaths of the global data are here in the US. (see the small data below)
6. At this rate, from Christmas, new year holidays and the harsh winter season, the infection rate and death rate are expected to pick up more.
7. With no good data collection, the current 13-19, 000 daily infections and 40-80 daily deaths is a warning as to the danger that follows. One death is too many. The situation is more complicated with other viral and bacterial infections.
8. Time again to trust the Lord and to use basic hygiene for protection.

2024 is going to bring ramped up judgments in all fronts.

| USA | | | | | |
|-----------------|------------------|--------------|------------------|--------------|--|
| Day | Total Infections | Total deaths | Daily infections | Daily deaths | |
| January 3, 2024 | 110,265,726 | 1,190,922 | +19,273 | +84 | |
| „ 4, „ | 110,278,908 | 1,190,971 | +13,182 | +49 | |
| World | | | | | |
| January 4, 2024 | 701,111,352 | 6,964,586 | +22,774 | +84 | |

***Trust the Lord!
And
Repent, Repent, Repent.***

Coronavirus subvariant JN.1 growing fast in US, already dominant in the Northeast.

“JN.1 is descended from BA.2.86, or Pirola, a subvariant that came to the world’s attention over the summer because of the large number of changes to its spike proteins: more than 30. Scientists feared that it was so mutated that it would completely escape the protection of vaccines and antibodies against Covid-19, perhaps sparking another tidal wave of illness the way the original Omicron variant did in 2021.”
